

CityServe

Connecting Customers
with Local Services

Team Cyphers

Problem Statement

Key challenges CityServe addresses in connecting residents with local services.

Hard to discover

Finding reliable local businesses is time-consuming.

Information is scattered

Services and offerings are fragmented across platforms.

Limited digital presence

Many local vendors lack visibility online.

Complex interactions

Ordering and coordinating with vendors is cumbersome.

No unified platform

Residents lack a single place to access and transact.

Proposed Solution

A unified ecosystem that brings customers, vendors, and administration together on one platform.

Centralized platform

Connects customers and vendors in one place.

Unified browsing

Customers discover and compare products and services easily.

Streamlined requests

Place orders and service requests quickly and securely.

Vendor management

Approve, manage, and support vendors with clear workflows.

Admin oversight

Monitor performance and make data-driven decisions.

Key Features & User Roles

CUSTOMER

- Register and login
- Browse categories, vendors, offerings
- Place orders and service requests
- Track order status
- Submit reviews for completed orders

VENDOR

- Register as vendor
- Manage business info and offerings
- Receive, approve/reject, and complete orders
- Access customer and order data

ADMIN

- Manage users and vendors
- Verify vendor registrations
- View platform analytics

System Architecture & Technology Stack

A modern, scalable architecture built with proven technologies for performance, reliability, and seamless integrations.

Database Design

A unified data model
connecting users, vendors,
offerings, orders, and reviews.

Application Workflow / Prototype

A seamless journey connecting residents with trusted local services.

Security, Validation & Reliability

JWT access and refresh tokens

with HttpOnly cookies

bcrypt password hashing

no passwords exposed via APIs

role-based authorization

and ownership checks

server-side order status

transition validation

review restrictions

one review per completed order only

Deployment, Testing & Results

Frontend TypeScript checks passed

Backend TypeScript checks passed

Next.js production build successful

Core customer/vendor/admin workflows tested and verified

Frontend-backend integration tested in live environment

FRONTEND

Deployed on Vercel

LIVE ENVIRONMENT

BACKEND

Deployed on Render

Conclusion & Future Scope

What We Built

Fully functional local services marketplace prototype

Unified product/service and order architecture

Role-based workflows for customers, vendors, and admins

Secure authentication and validation

Live, tested deployment

What's Next

Pagination for large data sets

Address book management

Full payment gateway integration

Offering image uploads

Notification system
